

Format Payroll API Guide

Response:

For this API, I'd design the UI as a **"Regenerate Payroll" modal/drawer** opened from the payroll details page. The key idea is: **show the existing payroll values, let the user edit only what needs changing, then preview the recalculated result before creating the new version.**

Suggested UI flow

1. Payroll Details Page

At the top:

Payroll Details	
Employee	
Jitendra Prajapati	EMP000101
Software Engineer	Engineering
Payroll Month: August 2026	
Version: 1	Status: APPROVED
[Regenerate Payroll]	
Earnings	
Amount	
Basic Salary	₹30,000
HRA	₹10,000
Special Allowance	₹0
Medical Allowance	₹0
Travel Allowance	₹0
Bonus	₹0
Other Allowance	₹0
Gross Salary	₹40,000

Attendance

Total Working Days	30
Worked Days	29
LOP Days	1
Payable Days	29

Deductions

PF	₹1,800
ESI	₹0
Professional Tax	₹200
Income Tax	₹0
Other Deduction	₹0
LOP Amount	₹1,333.33
Total Deduction	₹3,333.33
Net Payable	₹36,666.67

The **Regenerate Payroll** button should only appear for:

- DRAFT
- GENERATED
- APPROVED

2. Regenerate Payroll Modal

When the user clicks **Regenerate Payroll**:

Regenerate Payroll

Payroll #PR-202608-0005

Current Version: 1

Status: APPROVED

Update the fields that need to be changed.

Unchanged fields will retain their existing values.

ATTENDANCE

Total Working Days

30

Worked Days

29

LOP Days

1

EARNINGS

Basic Salary

₹30,000

HRA

₹10,000

Bonus

₹0

Special Allowance

₹0

Medical

₹0

Travel

₹0

Other Allowance

₹0

DEDUCTIONS

PF

₹1,800

ESI

₹0

Professional Tax

₹200

Income Tax

₹0

Other Deduction

₹0

REMARKS

Salary correction before approval

0 / 500 characters

[Cancel]

[Regenerate Payroll]

But I would make **one important UI improvement**.

Instead of making the user manually edit every field, visually distinguish **changed fields**.

For example:

Basic Salary

₹35,000

← edited

Changed from ₹30,000

This makes the regeneration operation much safer.

3. Add a Preview Step

After clicking **Regenerate Payroll**, don't immediately create the payroll.

Show:

Before → **After**

Payroll Regeneration Preview		
	CURRENT	NEW
Basic Salary	₹30,000	₹35,000
HRA	₹10,000	₹10,000
Bonus	₹0	₹5,000
LOP Days	1	2

Gross Salary	₹40,000	₹50,000
LOP Amount	₹1,333.33	₹3,333.33
Total Deduction	₹3,333.33	₹5,133.33
Net Payable	₹36,666.67	₹44,866.67

⚠ This will create Payroll Version 2.

Current Version 1 will become SUPERSEDED.
The new version will become ACTIVE.

Since the current payroll is APPROVED, the new payroll will require approval again.

[Back] [Confirm Regeneration]

This is particularly useful because your backend is creating a **new database record**, not updating the existing payroll.

4. After Successful Regeneration

Show a success message:

✓ Payroll Regenerated Successfully

Payroll Number: PR-202608-0006

Version: 2

Status: GENERATED

Previous Version: 1 → SUPERSEDED

New Version: 2 → ACTIVE

[View New Payroll]

Then navigate the user to the **new payroll details page**.

5. Version History

Since you're keeping old payroll records, I'd also add a **Version History** section.

Version History

Version	Payroll	Status	Net Payable	Action
2	PR-0006	GENERATED	₹44,866.67	View
1	PR-0005	SUPERSEDED	₹36,666.67	View

This will make the versioning feature very clear to HR/Admin.

Recommended overall flow

POST API

New Payroll Version
Version 2
ACTIVE
GENERATED

One UX point I'd strongly recommend

Don't expose `grossSalary`, `lopAmount`, `totalDeduction`, `netPayable`, and `payableDays` as **editable inputs**. Show them in a separate **"Calculated Payroll"** preview/card. That directly matches your API design and prevents users from thinking they can manually override backend calculations.
